

PART 1 — Check your two VPCs

Step 1: Open Region 1

AWS Console → select your first region.

Example:

Mumbai — ap-south-1

Go to:

VPC → Your VPCs

Find your VPC.

Write down:

VPC-1

VPC-1 CIDR: 192.168.0.0/16

PART 2 — Check Region 2

Change AWS Region at the top-right.

Example:

Singapore — ap-southeast-1

Go to:

VPC → Your VPCs

Find your second VPC.

Write down:

VPC-2

VPC-2 CIDR: 192.178.0.0/16

Very important

Choose different IPS for Defferent VPC

PART 3 — Find the EC2 private IPs

Go to **EC2 → Instances** in Region 1.

Select EC2-1.

Look under **Networking**.

Find:

Private IPv4 address

Example:

10.10.1.25

Now go to Region 2.

Select EC2-2.

Find its:

Private IPv4 address

Example:

10.20.1.25

Keep these two IPs.

PART 4 — Create VPC Peering

Now go back to **Region 1**.

Go to:

VPC → Peering connections

Click:

Create peering connection

Name

Region1-to-Region2

Requester VPC

Select:

VPC-1

Select another VPC

Because the VPC is in another region, select:

Another region

Choose:

Region 2

Then enter/select:

VPC-2

If both VPCs are in the **same AWS account**, choose the same-account option.

If they're in **different AWS accounts**, choose the **another account** option and enter the other account's AWS Account ID and VPC ID.

Then click:

Create peering connection

PART 5 — Accept the peering request

Now switch to **Region 2**.

Go to:

VPC → Peering connections

You should see:

Region1-to-Region2

Status: Pending Acceptance

Select it.

Click:

Actions → Accept request

Confirm.

Now the status should become:

Active

Checkpoint 1

If you see:

Status: Active

your **VPC peering itself is successfully created**.

But don't test EC2 yet.

We still need routes.

PART 6 — Add route in Region 1

This is one of the most important steps.

Go to **Region 1**.

Go to:

VPC → Route Tables

Find the route table used by the **subnet containing EC2-1**.

You can verify this through:

VPC → Subnets → select EC2-1's subnet → Route table

Open that route table.

Go to:

Routes → Edit routes → Add route

Enter:

Destination

Put the **VPC-2 CIDR**.

Example: **in VPC2 add VPC1 IPCIDR**

192.168.0.0/16

Target

Select:

Peering Connection

Select your peering connection.

It will look approximately like:

Destination	Target
-------------	--------

192.168.0.0/16	“peername”
----------------	------------

Click:

Save changes

PART 7 — Add route in Region 2

Now switch to **Region 2**.

Go to:

VPC → Route Tables

Find the route table used by the subnet containing **EC2-2**.

Go to:

Routes → Edit routes → Add route

Destination:

VPC-1 CIDR

Example:

192.178.0.0/16

Target:

Peering Connection

pcx-xxxxxxx

Save.

Now your routes should look like:

Region 1

10.10.0.0/16 → local

192.168.0.0/16 → VPC Peering

Region 2

10.20.0.0/16 → local

192.178.0.0/16 → VPC Peering

Checkpoint 2

Both sides must have routes.

Peering alone is not enough.

PART 8 — Configure Security Group

Now we allow EC2-1 to talk to EC2-2.

Go to **Region 2**.

Open the Security Group attached to **EC2-2**.

Go to:

Inbound rules → Edit inbound rules

Add:

Type: SSH

Protocol: TCP

Port: 22

Source: VPC-1 CIDR

Example:

SSH

TCP : 22

10.10.0.0/16

Save.

PART 9 — Allow ping for testing

This is optional but very useful.

In EC2-2's Security Group, add:

Type: All ICMP - IPv4

Source: 10.10.0.0/16

Save.

Now we can use ping to test the connection.

PART 10 — Test the connection

Now connect to **EC2-1**.

From EC2-1, run:

ping "Enter The region 2 EC2 private instance IP"

the **actual private IP of EC2-2**.

If it works

```
ap-south-1.console.aws.amazon.com/ec2-instance-connect/ssh/home?region=ap-south-1&connType=standard&instanceId=i-0432bd24f2eca1bf2&osUser=ubuntu&sshPort=22&addressFamily=ipv4

enable ESM Apps to receive additional future security updates.
See https://ubuntu.com/esm or run: sudo pro status

The list of available updates is more than a week old.
To check for new updates run: sudo apt update
